

DAC539G2-Q1 Automotive, 10-Bit Smart DAC for General-Purpose Input (GPI) to Pulse-Width-Modulation (PWM) Conversion With Auto-Detected I²C or SPI

1 Features

- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: –40°C to +125°C, T_A
- Triple general-purpose inputs
- PWM output using sawtooth or triangular waveform
- 10-bit GPI-to-voltage output
 - 1 LSB DNL
- Automatically detected I²C and SPI
 - 1.62-V V_{IH} with V_{DD} = 5.5 V
- MODE pin to select between programming and standalone modes
- User-programmable nonvolatile memory (NVM)
- Internal, external, and VDD reference
- Option for PWM-frequency-error correction
- Wide operating range
 - Power supply: 1.8 V to 5.5 V
- Tiny package: 16-pin WQFN (3 mm × 3 mm)

2 Applications

- [Rear light](#)
- [Condition monitoring module](#)
- [Wired control](#)

3 Description

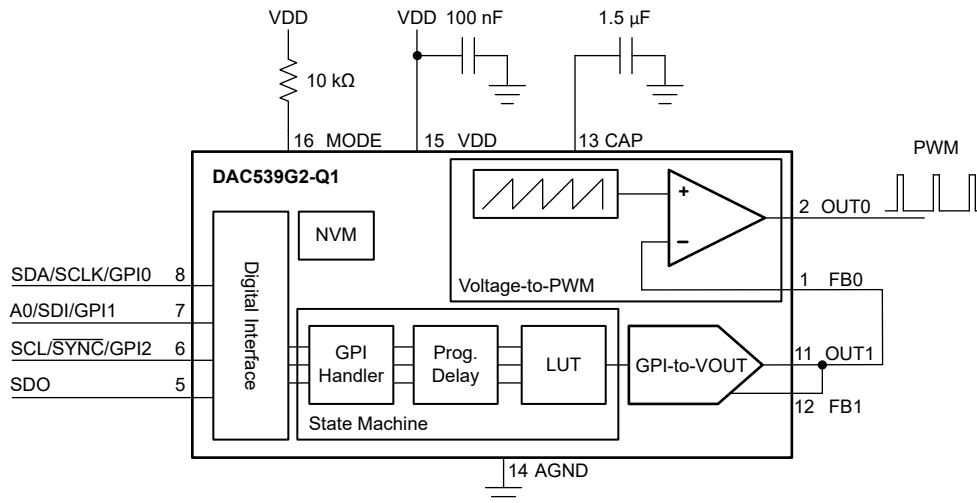

The DAC539G2-Q1 is an application-specific, look-up table (LUT) based GPI-to-PWM converter. This device has a 10-bit GPI-to-voltage output converter and a voltage-to-PWM converter. Both these circuits can be externally connected to create a GPI-to-PWM converter. Three GPIs are mapped to eight 10-bit digital codes that represent the voltage output. There is a programmable delay at the GPIs for eliminating glitches on these inputs. The look-up table values are programmed using I²C or SPI and stored in the NVM. The GPIs are multiplexed with the I²C and SPI. The voltage-to-PWM converter uses a comparator with one input as a programmable sawtooth or triangle waveform and the other input as an external voltage input.

This device automatically detects I²C and SPI and has an internal reference. The DAC539G2-Q1 is an excellent choice for fault communication in automotive stop and turn lights and similar industrial applications.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
DAC539G2-Q1	RTE (WQFN, 16)	3.00 mm × 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Pin Configuration and Functions

Figure 5-1. RTE Package, 16-pin WQFN (Top View)

Table 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	FB0	Input	Comparator input.
2	OUT0	Output	PWM output from comparator.
3	NC	—	Leave this pin unconnected.
4	NC	—	Leave this pin unconnected.
5	SDO	Output	Configuration mode (MODE pin low): SPI serial data output. Connect the pin to the I/O voltage with an external pullup resistor. Standalone mode (MODE pin high): Not connected.
6	SCL/SYNC/ GPI2	Output	Configuration mode (MODE pin low): I ² C serial interface clock or SPI chip select input. In the SPI chip select function, this pin must be connected to the I/O voltage using an external pullup resistor. Standalone mode (MODE pin high): General-purpose input 2.
7	A0/SDI/GPI1	Input	Configuration mode (MODE pin low): Address configuration input for I ² C or serial data input for SPI. In A0 function, connect this pin to VDD, AGND, SDA, or SCL for address configuration. In SDI function, this pin need not be pulled up or pulled down. Standalone mode (MODE pin high): General-purpose input 1.
8	SDA/SCLK/ GPI0	Input/ Output	Configuration mode (MODE pin low): Bidirectional I ² C serial data bus or SPI clock input. In the I ² C mode, connect this pin to the I/O voltage using an external pullup resistor. Standalone mode (MODE pin high): General-purpose input 0.
9	NC	—	Leave this pin unconnected.
10	NC	—	Leave this pin unconnected.
11	OUT1	Output	Voltage output for DAC.
12	FB1	Input	Voltage feedback input for the DAC output amplifier. Connect this pin to OUT1 for closed-loop voltage output.
13	CAP	Power	External bypass capacitor for the internal LDO. Connect a capacitor (approximately 1.5 μ F) between CAP and AGND.
14	AGND	Ground	Ground reference point for all circuitry on the device.
15	VDD	Power	Supply voltage: 1.8 V to 5.5 V.
16	MODE	Input	Interface selection and external reference input. Connect a capacitor (approximately 0.1 μ F) between MODE and AGND. Use a pullup resistor to VDD when external reference is not used. Do not ramp up this pin before VDD. If external reference is used, make sure the reference ramps up after VDD.
—	Thermal Pad	Ground	Connect the thermal pad to AGND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{DD}	Supply voltage, V _{DD} to AGND	-0.3	6	V
	Digital inputs to AGND	-0.3	V _{DD} + 0.3	V
	V _{FBX} to AGND	-0.3	V _{DD} + 0.3	V
	V _{OUTX} to AGND	-0.3	V _{DD} + 0.3	V
V _{REF}	External reference, V _{REF} to AGND	-0.3	V _{DD} + 0.3	V
	Current into any pin except the OUTx, VDD, and AGND pins	-10	10	mA
T _J	Junction temperature	-40	150	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾ HBM ESD classification level 2	±2000	V	
		Charged device model (CDM), per AEC Q100-011 CDM ESD classification level C4B	Corner pins (1, 4, 5, 8, 9, 12, 13, and 16)		±750
			All pins		±500

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Positive supply voltage to ground (AGND)	1.7		5.5	V
V _{REF}	External reference to ground (AGND)	1.7		V _{DD}	V
V _{IH}	Digital input high voltage, 1.7 V < V _{DD} ≤ 5.5 V	1.62			V
V _{IL}	Digital input low voltage			0.4	V
C _{CAP}	External capacitor on CAP pin	0.5		15	µF
T _A	Ambient temperature	-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DAC539G2-Q1	
		RTE (WQFN)	
		16 PINS	
			UNIT
R _{θJA}	Junction-to-ambient thermal resistance	49	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	50	°C/W
R _{θJB}	Junction-to-board thermal resistance	24.1	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	1.1	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	24.1	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	8.7	°C/W

- (1) For information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

6.5 Electrical Characteristics: Voltage Output

minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ and typical specifications at $T_A = 25^\circ\text{C}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, DAC reference tied to VDD, gain = 1 ×, DAC output pin (OUT) loaded with resistive load ($R_L = 5\text{ k}\Omega$ to AGND) and capacitive load ($C_L = 200\text{ pF}$ to AGND), and digital inputs at VDD or AGND (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE						
	Resolution		10			Bits
INL	Integral nonlinearity ⁽¹⁾		-1.25		1.25	LSB
DNL	Differential nonlinearity ⁽¹⁾		-1		1	LSB
	Zero-code error ⁽⁴⁾	Code 0d into DAC, external reference, $V_{DD} = 5.5\text{ V}$		6	12	mV
	Zero-code error ⁽⁴⁾	Code 0d into DAC, internal V_{REF} , gain = 4 ×, $V_{DD} = 5.5\text{ V}$		6	15	mV
	Zero-code error temperature coefficient ⁽⁴⁾			±10		μV/°C
	Offset error ⁽⁴⁾	$1.7\text{ V} \leq V_{DD} < 2.7\text{ V}$, V_{FB} pin shorted to V_{OUT} , DAC code: 8d	-0.75	0.3	0.75	%FSR
		$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, V_{FB} pin shorted to V_{OUT} , DAC code: 8d	-0.5	0.25	0.5	
	Offset-error temperature coefficient ⁽⁴⁾	V_{FB} pin shorted to V_{OUT} , DAC code: 8d		±0.0003		%FSR/°C
	Gain error ⁽⁴⁾	Between end-point codes: 8d and 1016d	-0.5	0.25	0.5	%FSR
	Gain-error temperature coefficient ⁽⁴⁾	Between end-point codes: 8d and 1016d		±0.0008		%FSR/°C
	Full-scale error ⁽⁴⁾	$1.7\text{ V} \leq V_{DD} < 2.7\text{ V}$, DAC at full-scale	-1		1	%FSR
	Full-scale error ⁽⁴⁾	$2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, DAC at full-scale	-0.6		0.6	%FSR
	Full-scale-error temperature coefficient ⁽⁴⁾	DAC at full-scale		±0.0008		%FSR/°C
OUTPUT						
	Output voltage	Reference tied to V_{DD}	0		V_{DD}	V
C_L	Capacitive load ⁽²⁾	$R_L = \text{infinite}$, phase margin = 30°			200	pF
		Phase margin = 30°			1000	
	Load regulation	DAC at midscale, $-10\text{ mA} \leq I_{OUT} \leq 10\text{ mA}$, $V_{DD} = 5.5\text{ V}$, $V_{REF} = 5.5\text{ V}$, V_{REF} not shorted to V_{DD}		0.007		mV/mA
	Short-circuit current	$V_{DD} = 1.7\text{ V}$, full-scale output shorted to AGND or zero-scale output shorted to V_{DD}		15		mA
		$V_{DD} = 2.7\text{ V}$, full-scale output shorted to AGND or zero-scale output shorted to V_{DD}		50		
		$V_{DD} = 5.5\text{ V}$, full-scale output shorted to AGND or zero-scale output shorted to V_{DD}		60		
	Output-voltage headroom ⁽²⁾	To V_{DD} (DAC output unloaded, internal reference = 1.21 V), $V_{DD} \geq 1.21\text{ V} \times \text{gain} + 0.2\text{ V}$	0.2			V
		To V_{DD} and to AGND (DAC output unloaded, external reference at V_{DD} (gain = 1 ×), the V_{REF} pin is not shorted to V_{DD})	0.8			%FSR
		To V_{DD} and to AGND ($I_{LOAD} = 10\text{ mA}$ at $V_{DD} = 5.5\text{ V}$, $I_{LOAD} = 3\text{ mA}$ at $V_{DD} = 2.7\text{ V}$, $I_{LOAD} = 1\text{ mA}$ at $V_{DD} = 1.8\text{ V}$), external reference at V_{DD} (gain = 1 ×), the V_{REF} pin is not shorted to V_{DD})	10			%FSR
	V_{OUT} dc output impedance	DAC output enabled and DAC code = midscale, $V_{DD} = 5.5\text{ V}$, external reference mode		0.007		Ω
		DAC output enabled and DAC code = 8d, $V_{DD} = 5.5\text{ V}$, external reference mode		0.25		
		DAC output enabled and DAC code = 1016d, $V_{DD} = 5.5\text{ V}$, external reference mode		0.25		

6.5 Electrical Characteristics: Voltage Output (continued)

minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ and typical specifications at $T_A = 25^\circ\text{C}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, DAC reference tied to VDD, gain = 1 ×, DAC output pin (OUT) loaded with resistive load ($R_L = 5\text{ k}\Omega$ to AGND) and capacitive load ($C_L = 200\text{ pF}$ to AGND), and digital inputs at VDD or AGND (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Z_O	V_{FB} dc output impedance ⁽³⁾	DAC output enabled, internal reference (gain = 1.5 × or 2 ×)	400	500	600	k Ω
		DAC output enabled, internal reference (gain = 3 × or 4 ×)	325	400	485	
	Power supply rejection ratio (dc)	Internal V_{REF} , gain = 2 ×, DAC at midscale, $V_{DD} = 5\text{ V} \pm 10\%$		0.25		mV/V
DYNAMIC PERFORMANCE						
t_{sett}	Output voltage settling time	1/4 to 3/4 scale and 3/4 to 1/4 scale settling to 10%FSR, $V_{DD} = 5.5\text{ V}$		20		μs
		1/4 to 3/4 scale and 3/4 to 1/4 scale settling to 10%FSR, $V_{DD} = 5.5\text{ V}$, internal V_{REF} , gain = 4 ×		25		
	Slew rate	$V_{DD} = 5.5\text{ V}$		0.3		V/ μs
	Power-on glitch magnitude	At start-up (DAC output disabled)		75		mV
		At start-up (DAC output disabled), $R_L = 100\text{ k}\Omega$		200		
	Output-enable glitch magnitude	DAC output disabled to enabled (DAC registers at zero scale), $R_L = 100\text{ k}\Omega$		250		mV
V_n	Output noise voltage (peak to peak)	$f = 0.1\text{ Hz}$ to 10 Hz , DAC at midscale, $V_{DD} = 5.5\text{ V}$		50		μV_{PP}
		Internal V_{REF} , gain = 4 ×, $f = 0.1\text{ Hz}$ to 10 Hz , DAC at midscale, $V_{DD} = 5.5\text{ V}$		90		
	Output noise density	$f = 1\text{ kHz}$, DAC at midscale, $V_{DD} = 5.5\text{ V}$		0.35		$\mu\text{V}/\sqrt{\text{Hz}}$
		Internal V_{REF} , gain = 4 ×, $f = 1\text{ kHz}$, DAC at midscale, $V_{DD} = 5.5\text{ V}$		0.9		
	Power supply rejection ratio (ac) ⁽³⁾	Internal V_{REF} , gain = 4 ×, 200-mV 50-Hz or 60-Hz sine wave superimposed on power supply voltage, DAC at midscale		-68		dB
	Code change glitch impulse	± 1 LSB change around midscale (including feedthrough)		10		nV-s
	Code change glitch impulse magnitude	± 1 LSB change around midscale (including feedthrough)		15		mV
POWER						
I_{DD}	Current flowing into VDD ⁽⁴⁾ ⁽⁵⁾	Normal operation, DACs at full scale, digital pins static, external reference at V_{DD} but the V_{REF} pin is not shorted to V_{DD}		150		$\mu\text{A}/\text{ch}$

- Measured with DAC output unloaded. For external reference and internal reference $V_{DD} \geq 1.21 \times \text{gain} + 0.2\text{ V}$, between end-point codes: 8d and 1016d.
- Specified by design and characterization, not production tested.
- Specified with 200-mV headroom with respect to reference value when internal reference is used.
- Measured with DAC output unloaded.
- The total power consumption is calculated by $I_{DD} \times (\text{total number of channels powered on}) + (\text{sleep-mode current})$.

6.6 Electrical Characteristics: Comparator Mode

minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ and typical specifications at $T_A = 25^\circ\text{C}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, DAC reference tied to VDD, gain = 1 × in voltage output mode, DAC output pin (OUT) loaded with resistive load ($R_L = 5\text{ k}\Omega$ to AGND) and capacitive load ($C_L = 200\text{ pF}$ to AGND), and digital inputs at VDD or AGND (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
STATIC PERFORMANCE					
Offset error ^{(1) (2)}	$1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$; DAC at midscale, comparator input at Hi-Z, and DAC operating with external reference	-7.5	0	7.5	mV
Offset error time drift ⁽¹⁾	$V_{DD} = 5.5\text{ V}$, $T_A = 125^\circ\text{C}$, FB in Hi-Z mode, DAC at full scale and V_{FB} at 0 V or DAC at zero scale and V_{FB} at 1.84 V, drift specified for 10 years of continuous operation		4		mV
OUTPUT					
Input voltage	V_{REF} connected to V_{DD} , V_{FB} resistor network connected to ground	0		V_{DD}	V
	V_{REF} connected to V_{DD} , V_{FB} resistor network disconnected from ground	0		$V_{DD} (1/3 - 1/100)$	
V_{OL}	Logic low output voltage $I_{LOAD} = 100\text{ }\mu\text{A}$, output in open-drain mode		0.1		V
DYNAMIC PERFORMANCE					
t_{resp}	Output response time DAC at midscale with 10-bit resolution, FB input at Hi-Z, and transition step at FB node is ($V_{DAC} - 2\text{ LSB}$) to ($V_{DAC} + 2\text{ LSB}$), transition time measured between 10% and 90% of output, output current of $100\text{ }\mu\text{A}$, comparator output configured in push-pull mode, load capacitor at DAC output is 25 pF		10		μs

- (1) Specified by design and characterization, not production tested.
(2) This specification does not include the total unadjusted error (TUE) of the DAC.

6.7 Electrical Characteristics: General

minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$ and typical specifications at $T_A = 25^\circ\text{C}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, DAC reference tied to VDD, gain = 1 × in voltage output mode, DAC output pin (OUT) loaded with resistive load ($R_L = 5\text{ k}\Omega$ to AGND) in voltage-output mode and capacitive load ($C_L = 200\text{ pF}$ to AGND), and digital inputs at VDD or AGND (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INTERNAL REFERENCE						
	Initial accuracy	$T_A = 25^\circ\text{C}$	1.1979	1.212	1.224	V
	Reference output temperature coefficient ^{(1) (2)}				60	ppm/ $^\circ\text{C}$
EXTERNAL REFERENCE						
	External reference input range		1.7		V_{DD}	V
	V_{REF} input impedance ^{(1) (3)}			192		k Ω -ch
EEPROM						
	Endurance ⁽¹⁾	$-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$		20000		Cycles
		$T_A = 125^\circ\text{C}$		1000		
	Data retention ⁽¹⁾	$T_A = 25^\circ\text{C}$		50		Years
	EEPROM programming write cycle time ⁽¹⁾				200	ms
	Device boot-up time ⁽¹⁾	Time taken from power valid ($V_{DD} \geq 1.7\text{ V}$) to output valid state (output state as programmed in EEPROM), 0.5- μF capacitor on the CAP pin		5		ms
DIGITAL INPUTS						
	Digital feedthrough	Voltage output mode, DAC output static at midscale, fast mode plus, SCL toggling		20		nV-s
	Pin capacitance	Per pin		10		pF
POWER-DOWN MODE 2						
I_{DD}	Current flowing into VDD	DAC in sleep mode, internal reference powered down, external reference at 5.5 V			28	μA
		DAC in sleep mode, internal reference enabled, additional current through internal reference		10		
	Current flowing into VDD ⁽¹⁾	DAC channels enabled, internal reference enabled, additional current through internal reference per DAC channel in voltage-output mode		12.5		
HIGH-IMPEDANCE OUTPUT						
I_{LEAK}	Current flowing into V_{OUTX} and V_{FBX}	DAC in Hi-Z output mode, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		10		nA
		$V_{DD} = 0\text{ V}$, $V_{OUT} \leq 1.5\text{ V}$, decoupling capacitor between V_{DD} and AGND = 0.1 μF		200		
		$V_{DD} = 0\text{ V}$, $1.5\text{ V} < V_{OUT} \leq 5.5\text{ V}$, decoupling capacitor between V_{DD} and AGND = 0.1 μF		500		
		100 k Ω between V_{DD} and AGND, $V_{OUT} \leq 1.25\text{ V}$, series resistance of 10 k Ω at OUT pin		± 2		μA

- (1) Specified by design and characterization, not production tested.
(2) Measured at -40°C and $+125^\circ\text{C}$ and calculated the slope.
(3) Impedances for the DAC channels are connected in parallel.

6.8 Timing Requirements: I²C Standard Mode

all input signals are timed from VIL to 70% of $V_{pull-up}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$, and $1.7\text{ V} \leq V_{pull-up} \leq V_{DD}$

		MIN	NOM	MAX	UNIT
f _{SCLK}	SCL frequency			100	kHz
t _{BUF}	Bus free time between stop and start conditions	4.7			μs
t _{HDSTA}	Hold time after repeated start	4			μs
t _{SUSTA}	Repeated start setup time	4.7			μs
t _{SUSTO}	Stop condition setup time	4			μs
t _{HDDAT}	Data hold time	0			ns
t _{SUDAT}	Data setup time	250			ns
t _{LOW}	SCL clock low period	4700			ns
t _{HIGH}	SCL clock high period	4000			ns
t _F	Clock and data fall time			300	ns
t _R	Clock and data rise time			1000	ns
t _{VDDAT}	Data valid time, R = 360 Ω, C _{trace} = 23 pF, C _{probe} = 10 pF			3.45	μs
t _{VDAACK}	Data valid acknowledge time, R = 360 Ω, C _{trace} = 23 pF, C _{probe} = 10 pF			3.45	μs

6.9 Timing Requirements: I²C Fast Mode

all input signals are timed from VIL to 70% of $V_{pull-up}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$, and $1.7\text{ V} \leq V_{pull-up} \leq V_{DD}$

		MIN	NOM	MAX	UNIT
f _{SCLK}	SCL frequency			400	kHz
t _{BUF}	Bus free time between stop and start conditions	1.3			μs
t _{HDSTA}	Hold time after repeated start	0.6			μs
t _{SUSTA}	Repeated start setup time	0.6			μs
t _{SUSTO}	Stop condition setup time	0.6			μs
t _{HDDAT}	Data hold time	0			ns
t _{SUDAT}	Data setup time	100			ns
t _{LOW}	SCL clock low period	1300			ns
t _{HIGH}	SCL clock high period	600			ns
t _F	Clock and data fall time			300	ns
t _R	Clock and data rise time			300	ns
t _{VDDAT}	Data valid time, R = 360 Ω, C _{trace} = 23 pF, C _{probe} = 10 pF			0.9	μs
t _{VDAACK}	Data valid acknowledge time, R = 360 Ω, C _{trace} = 23 pF, C _{probe} = 10 pF			0.9	μs

6.10 Timing Requirements: I²C Fast Mode Plus

all input signals are timed from VIL to 70% of $V_{pull-up}$, $1.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$, and $1.7\text{ V} \leq V_{pull-up} \leq V_{DD}$

		MIN	NOM	MAX	UNIT
f _{SCLK}	SCL frequency			1	MHz

7 Detailed Description

7.1 Overview

The DAC539G2-Q1 is an application-specific, look-up table (LUT) based GPI-to-PWM converter. This device has a 10-bit GPI-to-voltage output converter and a voltage-to-PWM converter. Both these circuits can be externally connected to create a GPI-to-PWM converter. Three GPIs are mapped to eight 10-bit digital codes that represent the voltage output. There is a programmable delay at the GPIs to eliminate glitches on these inputs. The look-up table values are programmed using I²C or SPI. The GPIs are multiplexed with the I²C and SPI pins. The voltage-to-PWM converter uses a comparator with one input as a programmable sawtooth or triangle waveform, and the other input as an external voltage input connected from the GPI-to-voltage converter.

This smart DAC use the MODE pin to select between programming mode (I²C or SPI) and standalone-application mode. The DAC539G2-Q1 provides nonvolatile memory (NVM) to store the register settings at factory using the I²C or SPI. After being programmed, this device functions autonomously without the need for a processor.

The DAC539G2-Q1 is an excellent choice for fault communication in automotive stop light and turn indicator modules. This device can also be used for fault communication in other industrial and automotive applications.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Smart Digital-to-Analog Converter (DAC) Architecture

The DAC539G2-Q1 uses a string architecture with a voltage-output amplifier for digital-to-analog converter functions. With an external FB pin, channel 0 functions as a programmable comparator. Channel 0 also functions as a voltage-to-PWM converter using a triangle or sawtooth waveform on the noninverting input of the amplifier. Channel 1 functions as a GPI-to-voltage converter using a look-up table with eight entries corresponding to all the binary combinations of the three GPI pins.

Section 7.2 shows the DAC architecture within the block diagram, which operates from a 1.8-V to 5.5-V power supply. Voltage output mode uses one of the three reference options: the power supply, the DAC internal voltage reference of 1.21 V, or an external reference. This device supports multiple programmable output ranges.

The DAC539G2-Q1 provides a state machine with configurable parameters, which converts three GPI signals to PWM output. Figure 7-1 shows the digital architecture of DAC539G2-Q1. The state machine is implemented in one-time programmable (OTP) memory that is one-to-one mapped to a static random access memory (SRAM). The application configuration data are stored in the SRAM section mapped to the NVM (EEPROM). The state machine can access the digital I/O directly while accessing the DAC outputs through the register map. The state machine is inaccessible by the end user. The state machine can be operated in standalone mode without interfacing to a processor (*processor-less operation*).

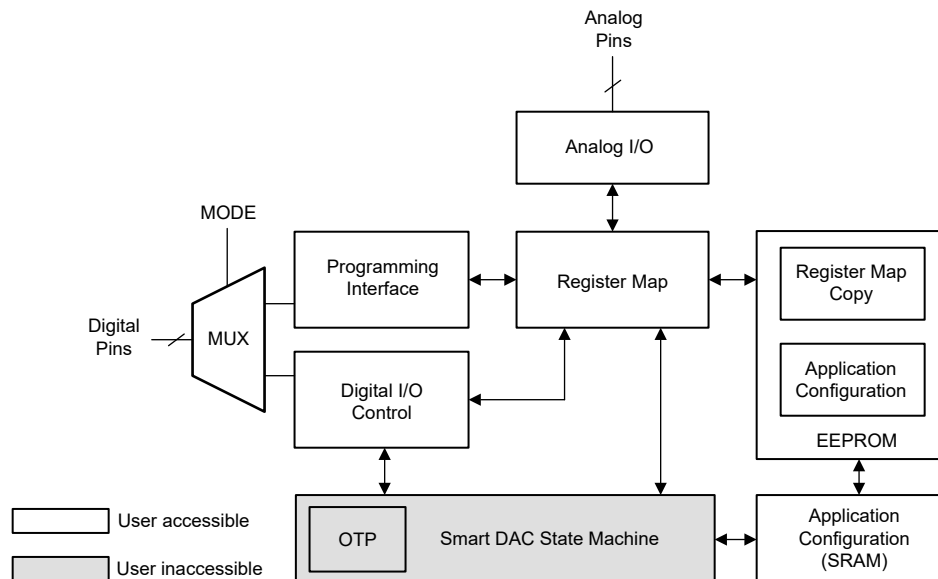

Figure 7-1. Smart DAC Architecture

7.3.2 Programming Interface

The DAC539G2-Q1 has five digital I/O pins that control I²C, SPI, GPI, and mode selection. The MODE pin must be at logic low to enable the programming interface. These devices automatically detect I²C and SPI protocols at the first successful communication after power-on, and then connect to the detected interface. After an interface protocol is connected, any change in the protocol is ignored. The I²C interface uses the A0 pin to select from among four address options. The SPI is a three-wire interface by default. No readback capability is available in three-wire SPI mode. The SDO pin can be enabled in the register map and then programmed into the NVM. The SPI readback mode is slower than the write mode. The programming interface pins are:

- I²C: SCL, SDA, A0
- SPI: SCLK, SDI, $\overline{\text{SYNC}}$, SDO

All the digital pins are open drain when used as outputs. Therefore, all the output pins must be pulled up to the desired I/O voltage using external resistors.

7.3.3 Nonvolatile Memory (NVM)

The DAC539G2-Q1 contains nonvolatile memory (NVM) bits. These memory bits are user programmable and erasable, and retain the set values in the absence of a power supply. The highlighted gray cells in [Table 7-9](#) show all the register bits that can be stored in the NVM by setting NVM-PROG = 1 in the COMMON-TRIGGER register. The NVM-PROG bit autoresets. The NVM-BUSY bit in the GENERAL-STATUS register is set to 1 by the device when an NVM write or reload operation is ongoing. During this time, the device blocks all read/write operations from and to the device. The NVM-BUSY bit is set to 0 after the write or reload operation is complete; at this point, all read/write operations from and to the device are allowed. The default value for all the registers in the DAC539G2-Q1 is loaded from NVM as soon as a POR event is issued.

The DAC539G2-Q1 also implements a NVM-RELOAD bit in the COMMON-TRIGGER register. Set this bit to 1 for the device to start an NVM-reload operation. The NVM-reload operation overwrites the register map with the stored data from the NVM. After completion, the device autoresets this bit to 0. During the NVM-RELOAD operation, the NVM-BUSY bit is set to 1.

7.4 Device Functional Modes

7.4.1 GPI-to-Voltage Converter

The output for each channel is enabled by selecting the power-up option in the VOUT-PDN-X fields in the COMMON-CONFIG register. For the GPI-to-voltage converter, short the OUT1 and FB1 pins externally for a closed-loop amplifier output. An open FB1 pin saturates the amplifier output. To achieve the desired voltage output, select the correct reference option, select the amplifier gain for the required output range, and program the look-up table with DAC codes in the VOUT-DATA-X register. [Table 7-1](#) shows the GPI to look-up table register mapping.

Table 7-1. GPI-to-Voltage Converter Look up Table

GPI2	GPI1	GPI0	Register	Default Value
0	0	0	VOUT-DATA-0	3900h
0	0	1	VOUT-DATA-1	9940h
0	1	0	VOUT-DATA-2	5900h
0	1	1	VOUT-DATA-3	7940h
1	0	0	VOUT-DATA-4	3900h
1	0	1	VOUT-DATA-5	9940h
1	1	0	VOUT-DATA-6	5900h
1	1	1	VOUT-DATA-7	7940h

The DAC539G2-Q1 also supports a programmable delay to suppress or debounce any unwanted glitch on the GPI pins. A change in the GPI signals is passed to the GPI-to-voltage converter only when the change is stable for more than the delay configured using the DEBOUNCE-DELAY field in the GPI-DEBOUNCE register. The default debounce delay is approximately 50 ms. [Figure 7-2](#) shows the flowchart for the GPI-to-voltage conversion.

Figure 7-2. GPI-to-Voltage Conversion Flowchart

7.4.1.1 Voltage Reference and DAC Transfer Function

Figure 7-3 shows the three possible voltage reference options with the DAC539G2-Q1: the power supply as reference, internal reference, or external reference (MODE pin). The DAC transfer function in the voltage-output and comparator modes changes based on the voltage reference selection.

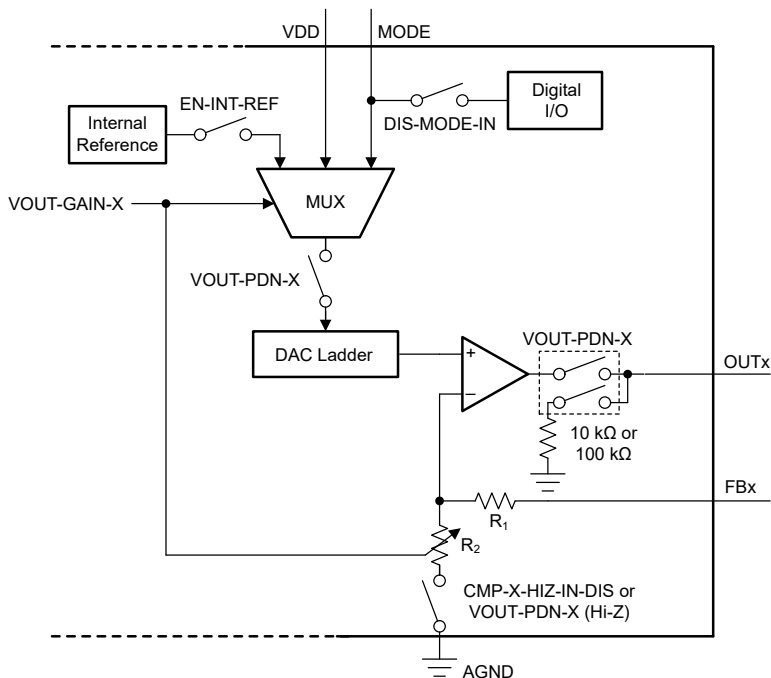

Figure 7-3. Voltage Reference Selection and Power-Down Logic

7.4.1.2 Power-Supply as Reference

By default, the DAC539G2-Q1 operates with the power-supply pin (VDD) as a reference. Equation 1 shows DAC transfer function when the power-supply pin is used as reference. The gain at the output stage is always 1 ×.

$$V_{OUT} = \frac{V_{OUT_DATA_X}}{2^N} \times V_{DD} \quad (1)$$

where:

- N is the resolution in bits, that is 10 bits.
- VOUT_DATA_X is the decimal equivalent of the binary code that is loaded to the VOUT-DATA-X field in the VOUT-DATA-X register.
- VOUT_DATA_X ranges from 0 to $2^N - 1$.
- V_{DD} is used as the DAC reference voltage.

7.4.1.3 Internal Reference

The DAC539G2-Q1 contains an internal reference that is disabled by default. To enable the internal reference, write 1 to bit EN-INT-REF in the COMMON-CONFIG register. The internal reference generates a fixed 1.21-V voltage (typical). Use the VOUT-GAIN-X field in the DAC-X-VOUT-CMP-CONFIG register to achieve gains of 1.5 ×, 2 ×, 3 ×, or 4 × for the DAC output voltage (V_{OUT}). Equation 2 shows DAC transfer function using the internal reference.

$$V_{OUT} = \frac{V_{OUT_DATA_X}}{2^N} \times V_{REF} \times GAIN \quad (2)$$

where:

- N is the resolution in bits, that is 10 bits
- VOUT_DATA_X is the decimal equivalent of the binary code that is loaded to the VOUT-DATA-X field in the VOUT-DATA-X register.
- VOUT_DATA_X ranges from 0 to 2^N – 1.
- V_{REF} is the internal reference voltage = 1.21 V.
- GAIN = 1.5 ×, 2 ×, 3 ×, or 4 ×, based on VOUT-X-GAIN bits.

7.4.1.4 External Reference

The DAC539G2-Q1 provide an external reference input. Select the external reference option by configuring the VOUT-GAIN-X field in the DAC-X-VOUT-CMP-CONFIG register appropriately. Write 1 to the DIS-MODE-IN bit in the DEVICE-MODE-CONFIG register to minimize quiescent current. The external reference can be between 1.8 V and VDD. Equation 3 shows DAC transfer function when the external reference is used.

Note

The external reference must be less than VDD in both transient and steady-state conditions. Therefore, the external reference must ramp up after VDD and ramp down before VDD.

$$V_{OUT} = \frac{DAC_DATA}{2^N} \times V_{REF} \quad (3)$$

where:

- N is the resolution in bits, 10 bits for DAC539G2-Q1.
- DAC_DATA is the decimal equivalent of the binary code that is loaded to the DAC-X-DATA field in the DAC-X-DATA register.
- DAC_DATA ranges from 0 to 2^N – 1.
- V_{REF} is the external reference voltage.

7.4.2 Voltage-to-PWM Converter

Channel 0 functions as the voltage-to-PWM converter. Channel 1 can also be used as a comparator, if needed after the application is stopped using the STATE_MACHINE-CONFIG register. To enter the comparator mode for a channel, write 1 to the CMP-X-EN and the CMP-X-OUT-EN bits in the respective DAC-X-VOUT-CMP-CONFIG register. The comparator output can be configured as push-pull or open-drain using the CMP-X-OD-EN bit. To invert the comparator output, write 1 to the CMP-X-INV-EN bit. The FBx pin has a finite impedance. To enable high-impedance on the FBx pin, write 1 to the CMP-X-HIZ-IN-DIS bit.

Note

In the Hi-Z input mode, the comparator input range is limited to:

- For GAIN = 1 ×, 1.5 ×, or 2 ×: $V_{FB} \leq (V_{REF} \times GAIN) / 3$
- For GAIN = 3 ×, or 4 ×: $V_{FB} \leq (V_{REF} \times GAIN) / 6$

Any higher input voltage is clipped.

7.4.2.1 Function Generation

The DAC539G2-Q1 implements a continuous waveform generation feature. This device generates a triangular wave or a sawtooth wave on channel 0 for voltage-to-PWM conversion.

7.4.2.1.1 Triangular Waveform Generation

Figure 7-4 shows that the triangular waveform uses the FUNCTION-MIN and FUNCTION-MAX registers for minimum and maximum levels, respectively. Equation 4 calculates the frequency of the waveform depending on the minimum and maximum levels, and the CODE-STEP and TIME-STEP settings. An external resistor-capacitor (RC) load with a time-constant greater than the TIME-STEP settings can be dominant over the internal frequency calculation. The CODE-STEP and TIME-STEP settings are available in the FUNCTION-CONFIG register. Write 0b000 to the FUNCTION-SELECT bit field in the FUNCTION-CONFIG register to select the triangular waveform.

$$f_{TRIANGLE} = \frac{1}{2 \times TIME_STEP \times CEILING\left(\frac{FUNCTION_MAX - FUNCTION_MIN}{CODE_STEP}\right)} \quad (4)$$

where:

- TIME_STEP is the TIME-STEP setting specified in the FUNCTION-CONFIG register.
- CODE_STEP is the CODE-STEP setting specified in the FUNCTION-CONFIG register.
- FUNCTION_MAX is the decimal value specified in the FUNCTION-MAX register. Specify the value of FUNCTION_MAX as $\min(\text{full code}, (\text{FUNCTION_MIN} + n \times \text{CODE_STEP}))$, where n is an integer.
- FUNCTION_MIN is the decimal value specified in the FUNCTION-MIN register.

Figure 7-4. Triangle Waveform

7.4.2.1.2 Sawtooth Waveform Generation

Figure 7-5 shows that the sawtooth and the inverse sawtooth waveforms use the FUNCTION-MIN and FUNCTION-MAX registers for minimum and maximum levels, respectively. Equation 5 calculates the frequency of the waveform, depending on the minimum and maximum levels, and the CODE-STEP and TIME-STEP settings. An external RC load with a time constant greater than the TIME-STEP settings can be dominant over the internal frequency calculation. The CODE-STEP and TIME-STEP settings are available in the FUNCTION-CONFIG register. Write 0b001 to the FUNCTION-SELECT bit field in the FUNCTION-CONFIG register to select the sawtooth waveform, and write 0b010 to select the inverse sawtooth waveform.

$$f_{SAWTOOTH} = \frac{1}{TIME_STEP \times CEILING\left(\frac{FUNCTION_MAX - FUNCTION_MIN}{CODE_STEP} + 1\right)} \quad (5)$$

where:

- TIME_STEP is the TIME-STEP setting as specified in the FUNCTION-CONFIG register.
- CODE_STEP is the CODE-STEP setting as specified in the FUNCTION-CONFIG register.
- FUNCTION_MAX is the decimal value specified in the FUNCTION-MAX register. Specify the value of FUNCTION_MAX as min(full code, (FUNCTION_MIN + n × CODE_STEP)), where n is an integer.
- FUNCTION_MIN is the decimal value specified in the FUNCTION-MIN register.

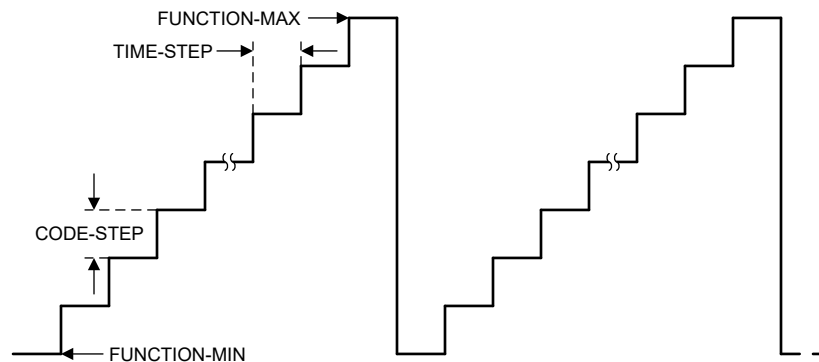

Figure 7-5. Sawtooth Waveform

7.4.2.1.3 PWM Frequency Correction

The accuracy of the waveform frequencies depend on the accuracy of the internal oscillator. The DAC539G2-Q1 supports a calibration option to get the best PWM frequency accuracy. The FREQUENCY-ERROR bits in the PWM-FREQUENCY-ERROR register store the oscillator error in 2's compliment format. The stored error resolution is 0.2% per LSB. Equation 6 calculates the percentage frequency error.

$$f_{ERROR}(\%) = FREQUENCY_ERROR \times 0.2 \quad (6)$$

To correct the PWM frequency error, either FUNCTION-MAX or FUNCTION-MIN or both values need to be adjusted with respect to the error magnitude. Invert Equation 4 and Equation 5 to calculate the required correction factor.

7.4.3 Device Reset and Fault Management

This section provides the details of power-on-reset (POR), software reset, and other diagnostics and fault-management features of the DAC539G2-Q1.

7.4.3.1 Power-On Reset (POR)

The DAC539G2-Q1 includes a power-on reset (POR) function that controls the output voltage at power up. After the V_{DD} supply has been established, a POR event is issued. The POR causes all registers to initialize to default values, and communication with the device is valid only after a POR (boot-up) delay. The default value for all the registers in the DAC539G2-Q1 is loaded from NVM as soon as the POR event is issued.

When the device powers up, a POR circuit sets the device to the default mode. [Figure 7-6](#) shows that the POR circuit requires specific V_{DD} levels to make sure that the internal capacitors discharge and reset the device at power up. To make sure that a POR occurs, V_{DD} must be less than 0.7 V for at least 1 ms. When V_{DD} drops to less than 1.65 V, but remains greater than 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions. In this case, initiate a POR. When V_{DD} remains greater than 1.65 V, a POR does not occur.

Figure 7-6. Threshold Levels for V_{DD} POR Circuit

7.4.3.2 External Reset

An external reset to the device is triggered through the register map. To initiate a device software reset event, write the reserved code 0b1010 to the RESET field in the COMMON-TRIGGER register. A software reset initiates a POR event.

7.4.3.3 Register-Map Lock

The DAC539G2-Q1 implements a register-map lock feature that prevents an accidental or unintended write to the DAC registers. The device locks all the registers when the DEV-LOCK bit in the COMMON-CONFIG register is set to 1. However, the software reset function through the COMMON-TRIGGER register is not blocked when using I²C. To bypass the DEV-LOCK setting, write 0b0101 to the DEV-UNLOCK bits in the COMMON-TRIGGER register.

7.4.3.4 NVM Cyclic Redundancy Check (CRC)

The DAC539G2-Q1 implements a cyclic redundancy check (CRC) feature for the NVM to make sure that the data stored in the NVM is uncorrupted. There are two types of CRC alarm bits implemented in DAC539G2-Q1:

- NVM-CRC-FAIL-USER
- NVM-CRC-FAIL-INT

The NVM-CRC-FAIL-USER bit indicates the status of the user-programmable NVM bits, and the NVM-CRC-FAIL-INT bit indicates the status of the internal NVM bits. The CRC feature is implemented by storing a 16-bit CRC (CRC-16-CCITT) along with the NVM data each time an NVM program operation (write or reload) is performed and during the device start-up. The device reads the NVM data and validates the data with the stored CRC. The CRC alarm bits (NVM-CRC-FAIL-USER and NVM-CRC-FAIL-INT in the GENERAL-STATUS register) report any errors after the data are read from the device NVM. The alarm bits are set only at boot up.

7.4.3.4.1 NVM-CRC-FAIL-USER Bit

A logic 1 on the NVM-CRC-FAIL-USER bit indicates that the user-programmable NVM data are corrupt. During this condition, all registers in the DAC are initialized with factory reset values, and all DAC registers can be written to or read from. To reset the alarm bits to 0, issue a software reset command (see [Section 7.4.3.2](#)), or cycle power to the DAC. A software reset or power-cycle also reloads the user-programmable NVM bits. In case the failure persists, reprogram the NVM.

7.4.3.4.2 NVM-CRC-FAIL-INT Bit

A logic 1 on NVM-CRC-FAIL-INT bit indicates that the internal NVM data are corrupt. During this condition, all registers in the DAC are initialized with factory reset values, and all DAC registers can be written to or read from. In case of a temporary failure, to reset the alarm bits to 0, issue a software reset command (see [Section 7.4.3.2](#)) or cycle power to the DAC. A permanent failure in the NVM makes the device unusable.

7.4.4 Power-Down Mode

The DAC539G2-Q1 output amplifier and internal reference can be independently powered down through the EN-INT-REF and VOUT-PDN-X bits in the COMMON-CONFIG register (see [Figure 7-3](#)). At power up, the DAC outputs are enabled and the internal reference is disabled by default. Use the VOUT-PDN-X bits to configure the DAC outputs (OUTx pins) as Hi-Z, 10 kΩ-A_{GND}, or 100 kΩ-A_{GND} power-down mode.

The DAC power-up state can be programmed to any state (power-down or normal mode) using the NVM. [Table 7-2](#) shows the DAC power-down bits.

Table 7-2. DAC Power-Down Bits

REGISTER	VOUT-PDN-X[1]	VOUT-PDN-X[0]	DESCRIPTION
COMMON-CONFIG	0	0	Power up VOUT-X.
	0	1	Power down VOUT-X with 10 kΩ to AGND.
	1	0	Power down VOUT-X with 100 kΩ to AGND.
	1	1	Power down VOUT-X to Hi-Z.

7.5 Programming

7.5.1 SPI Programming Mode

An SPI access cycle for the DAC539G2-Q1 is initiated by asserting the $\overline{\text{SYNC}}$ pin low. The serial clock, SCLK, can be continuous or gated. SDI data are clocked on the SCLK falling edges. The SPI frame for the DAC539G2-Q1 is 24 bits long. Therefore, the $\overline{\text{SYNC}}$ pin must stay low for at least 24 SCLK falling edges. The access cycle ends when the $\overline{\text{SYNC}}$ pin is deasserted high. If the access cycle contains less than the minimum clock edges, the communication is ignored. By default, the SDO pin is not enabled (three-wire SPI). In three-wire SPI mode, if the access cycle contains more than the minimum clock edges, only the first 24 bits are used by the device. When $\overline{\text{SYNC}}$ is high, the SCLK and SDI signals are blocked, and SDO becomes Hi-Z to allow data readback from other devices connected on the bus.

Table 7-3 and Figure 7-7 describe the format for the 24-bit SPI access cycle. The first byte input to SDI is the instruction cycle. The instruction cycle identifies the request as a read or write command and the 7-bit address that is to be accessed. The last 16 bits in the cycle form the data cycle.

Table 7-3. SPI Read/Write Access Cycle

BIT	FIELD	DESCRIPTION
23	R/ \overline{W}	Identifies the communication as a read or write command to the address register: R/ \overline{W} = 0 sets a write operation. R/ \overline{W} = 1 sets a read operation
22-16	A[6:0]	Register address: specifies the register to be accessed during the read or write operation
15-0	D[15:0]	Data cycle bits: If a write command, the data cycle bits are the values to be written to the register with address A[6:0]. If a read command, the data cycle bits are <i>don't care</i> values.

Figure 7-7. SPI Write Cycle

Read operations require that the SDO pin is first enabled by setting the SDO-EN bit in the INTERFACE-CONFIG register. This configuration is called four-wire SPI. A read operation is initiated by issuing a read command access cycle. After the read command, a second access cycle must be issued to get the requested data. Table 7-4 and Figure 7-8 show the output data format. Data are clocked out on the SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit (see also Figure 6-3).

Table 7-4. SDO Output Access Cycle

BIT	FIELD	DESCRIPTION
23	R/ \overline{W}	Echo R/ \overline{W} from previous access cycle
22-16	A[6:0]	Echo register address from previous access cycle
15-0	D[15:0]	Readback data requested on previous access cycle

Figure 7-8. SPI Read Cycle

The daisy-chain operation is also enabled with the SDO pin. Figure 7-9 shows that in daisy-chain mode, multiple devices are connected in a *chain* with the SDO pin of one device is connected to SDI pin of the following device. The SPI host drives the SDI pin of the first device in the chain. The SDO pin of the last device in the chain is connected to the POCI pin of the SPI host. In four-wire SPI mode, if the access cycle contains multiples of 24 clock edges, only the last 24 bits are used by the device first device in the chain. If the access cycle contains clock edges that are not in multiples of 24, the SPI packet is ignored by the device. Figure 7-10 describes the packet format for the daisy-chain write cycle.

Figure 7-9. SPI Daisy-Chain Connection

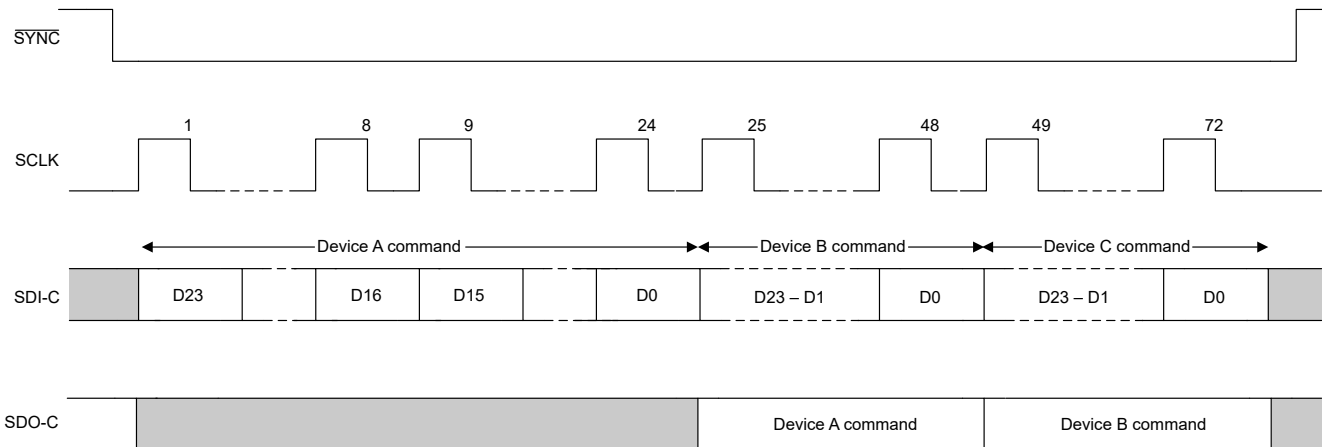

Figure 7-10. SPI Daisy-Chain Write Cycle

7.5.2 I²C Programming Mode

The DAC539G2-Q1 has a 2-wire serial interface (SCL and SDA), and one address pin (A0); see also [Figure 5-1](#). The I²C bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I²C-compatible devices connect to the I²C bus through the open drain I/O pins, SDA and SCL.

The I²C specification states that the device that controls communication is called a *controller*, and the devices that are controlled by the controller are called *targets*. The controller generates the SCL signal. The controller also generates special timing conditions (start condition, repeated start condition, and stop condition) on the bus to indicate the start or stop of a data transfer. Device addressing is completed by the controller. The controller on an I²C bus is typically a microcontroller or digital signal processor (DSP). The DAC539G2-Q1 operates as a target on the I²C bus. A target acknowledges controller commands, and upon controller control, receives or transmits data.

Typically, the DAC539G2-Q1 family operates as a target receiver. A controller writes to the DAC539G2-Q1, a target receiver. However, if a controller requires the DAC539G2-Q1 internal register data, the DAC539G2-Q1 operates as a target transmitter. In this case, the controller reads from the DAC539G2-Q1. According to I²C terminology, read and write refer to the controller.

The DAC539G2-Q1 supports the following data transfer modes:

- Standard mode (100Kbps)
- Fast mode (400Kbps)
- Fast mode plus (1.0Mbps)

The data transfer protocol for standard and fast modes is exactly the same; therefore, both modes are referred to as *F/S-mode* in this document. The fast mode plus protocol is supported in terms of data transfer speed, but not output current. The low-level output current is 3 mA; similar to the case of standard and fast modes. The DAC539G2-Q1 supports 7-bit addressing. The 10-bit addressing mode is not supported. The device supports the general call reset function. Sending the following sequence initiates a software reset within the device: start or repeated start, 0x00, 0x06, stop. The reset is asserted within the device on the rising edge of the ACK bit, following the second byte.

Other than specific timing signals, the I²C interface works with serial bytes. At the end of each byte, a ninth clock cycle generates and detects an acknowledge signal. An acknowledge is when the SDA line is pulled low during the high period of the ninth clock cycle. [Figure 7-11](#) depicts a not-acknowledge, when the SDA line is left high during the high period of the ninth clock cycle.

Figure 7-11. Acknowledge and Not Acknowledge on the I²C Bus

7.5.2.1 F/S Mode Protocol

The following steps explain a complete transaction in F/S mode.

1. The controller initiates data transfer by generating a start condition. [Figure 7-12](#) shows that the start condition is when a high-to-low transition occurs on the SDA line while SCL is high. All I²C-compatible devices recognize a start condition.
2. The controller then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit (R/\bar{W}) on the SDA line. During all transmissions, the controller makes sure that data are valid. [Figure 7-13](#) shows that a valid data condition requires the SDA line to be stable during the entire high period of the clock pulse. All devices recognize the address sent by the controller and compare the address to the respective internal fixed address. Only the target device with a matching address generates an acknowledge by pulling the SDA line low during the entire high period of the 9th SCL cycle (see also [Figure 7-11](#)). When the controller detects this acknowledge, the communication link with a target has been established.
3. The controller generates further SCL cycles to transmit (R/\bar{W} bit 0) or receive (R/\bar{W} bit 1) data to the target. In either case, the receiver must acknowledge the data sent by the transmitter. The acknowledge signal can be generated by the controller or by the target, depending on which is the receiver. The 9-bit valid data sequences consists of eight data bits and one acknowledge-bit, and can continue as long as necessary.
4. [Figure 7-12](#) shows that to signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low-to-high while the SCL line is high. This action releases the bus and stops the communication link with the addressed target. All I²C-compatible devices recognize the stop condition. Upon receipt of a stop condition, the bus is released, and all target devices then wait for a start condition followed by a matching address.

Figure 7-12. Start and Stop Conditions

Figure 7-13. Bit Transfer on the I²C Bus

7.5.2.2 I²C Update Sequence

Table 7-5 shows that for a single update, the DAC539G2-Q1 requires a start condition, a valid I²C address byte, a command byte, and two data bytes.

Table 7-5. Update Sequence

MSB	LSB	ACK	MSB	...	LSB	ACK	MSB	...	LSB	ACK	MSB	...	LSB	ACK
Address (A) byte Section 7.5.2.2.1				Command byte Section 7.5.2.2.2				Data byte - MSDB				Data byte - LSDB			
DB [31:24]				DB [23:16]				DB [15:8]				DB [7:0]			

Figure 7-14 shows that after each byte is received, the DAC539G2-Q1 acknowledges the byte by pulling the SDA line low during the high period of a single clock pulse. These four bytes and acknowledge cycles make up the 36 clock cycles required for a single update to occur. A valid I²C address byte selects the DAC539G2-Q1.

Figure 7-14. I²C Bus Protocol

The command byte sets the operating mode of the selected DAC539G2-Q1 device. For a data update to occur when the operating mode is selected by this byte, the DAC539G2-Q1 device must receive two data bytes: the most significant data byte (MSDB) and least significant data byte (LSDB). The DAC539G2-Q1 device performs an update on the falling edge of the acknowledge signal that follows the LSDB.

When using fast mode (clock = 400 kHz), the maximum DAC update rate is limited to 10 kSPS. Using fast mode plus (clock = 1 MHz), the maximum DAC update rate is limited to 25 kSPS. When a stop condition is received, the DAC539G2-Q1 device releases the I²C bus and awaits a new start condition.

7.5.2.2.1 Address Byte

Table 7-6 depicts the address byte, the first byte received from the controller device following the start condition. The first four bits (MSBs) of the address are factory preset to 0b1001. The next three bits of the address are controlled by the A0 pin. The A0 pin input can be connected to VDD, AGND, SCL, or SDA. The A0 pin is sampled during the first byte of each data frame to determine the address. The device latches the value of the address pin, and consequently responds to that particular address according to Table 7-7.

Table 7-6. Address Byte

COMMENT	MSB							LSB
	AD6	AD5	AD4	AD3	AD2	AD1	AD0	R/W
—								
General address	1	0	0	1	See Table 7-7 (target address column)			0 or 1
Broadcast address	1	0	0	0	1	1	1	0

Table 7-7. Address Format

TARGET ADDRESS	A0 PIN
000	AGND
001	VDD
010	SDA
011	SCL

The DAC539G2-Q1 supports broadcast addressing, which is used for synchronously updating or powering down multiple DAC539G2-Q1 devices. When the broadcast address is used, the DAC539G2-Q1 responds regardless of the address pin state. Broadcast is supported only in write mode.

7.5.2.2.2 Command Byte

Table 7-10 lists the command byte in the ADDRESS column.

7.5.2.3 I²C Read Sequence

To read any register the following command sequence must be used:

1. Send a start or repeated start command with a target address and the R/\overline{W} bit set to 0 for writing. The device acknowledges this event.
2. Send a command byte for the register to be read. The device acknowledges this event again.
3. Send a repeated start with the target address and the R/\overline{W} bit set to 1 for reading. The device acknowledges this event.
4. The device writes the MSDB byte of the addressed register. The controller must acknowledge this byte.
5. Finally, the device writes out the LSDB of the register.

The broadcast address cannot be used for reading.

Table 7-8. Read Sequence

S	MSB	...	R/W (0)	ACK	MSB	...	LSB	ACK	Sr	MSB	...	R/W (1)	ACK	MSB	...	LSB	ACK	MSB	...	LSB	ACK

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The DAC539G2-Q1 is a dual-channel, buffered, force-sense output, voltage-output smart DAC that includes an NVM and internal reference, and is available in a tiny 3-mm × 3-mm package. The FBx pins function as inputs in comparator mode. The device is configured as an application-specific, look-up table (LUT) based GPI-to-PWM converter. One DAC channel is configured in voltage-output mode, and the other is configured as a comparator for PWM output. Three digital inputs control an internal LUT to select between eight configurable 10-bit DAC codes on the voltage output. The comparator channel is configured for a triangle or sawtooth waveform that sets the threshold of the comparator. Connect the LUT output to the FB0 input of the comparator to achieve the PWM output from the comparator output. The PWM frequency error is stored in the device and is calibrated out by adjusting the triangle- or sawtooth-wave frequency. The LUT values are programmed using I²C or SPI and stored in the NVM. The GPIs are multiplexed with other digital pins. The MODE pin determines whether the device is in programming or standalone mode.

8.2 Typical Application

This design uses a dual-channel, buffered voltage output smart DAC to decode three GPIs into a constant-frequency PWM output with eight selectable duty-cycle levels. In this design, the integrated buffer acts as a comparator, and a triangle or sawtooth waveform generated by the device acts as the threshold for the comparator. The DAC539G2-Q1 output buffers have an exposed feedback path through the feedback pin (FBx), which acts as the voltage input to the comparator. The comparator generates a PWM output with the same frequency as the triangle or sawtooth wave, and a duty cycle that depends on the FBx input. Use this circuit in applications such as automotive rear lights, rear light fault indication, and fault communication in factory automation and control designs. [Figure 8-1](#) shows how to connect the two DAC outputs to achieve a PWM output.

Figure 8-1. GPI to PWM

8.2.1 Design Requirements

Table 8-1. Design Parameters

PARAMETER	VALUE
Frequency	100 Hz
Duty cycle	12.5%, 25%, 37.5%, 50%, 62.5%, 75%, 87.5%, 100%
Delay	50 ms

8.2.2 Detailed Design Procedure

Calculate the PWM frequency by using the time steps and code step from [Table 7-22](#), either [Equation 4](#) for a triangle wave or [Equation 5](#) for a sawtooth wave, and the selected FUNCTION-MAX and FUNCTION-MIN DAC codes. [Section 7.4.2.1](#) describes the details on the function generation settings. The FUNCTION-MAX and FUNCTION-MIN DAC codes represent the peaks of the triangle or sawtooth waveforms. To achieve a frequency of 100 Hz, this example uses a triangle wave with a margin high of 725, a margin low of 100, slew rate of 8 μ s, and code step of 1 LSB:

$$f_{TRIANGLE} = \frac{1}{2 \times 8 \mu s \times CEILING\left(\frac{725 - 100}{1}\right)} = 100 \text{ Hz} \quad (7)$$

The DAC539G2-Q1 is a 10-bit device, which means the maximum DAC code is 1023d. Choose margin-high and -low values that are away from the endpoints to avoid effects from the zero-code and full-scale errors.

For small step sizes, the duty cycles can be estimated by:

$$Duty_Cycle_{TRIANGLE} = \frac{FUNCTION_MAX - VOUT_DATA_X}{CEILING\left(\frac{FUNCTION_MAX - FUNCTION_MIN}{CODE_STEP}\right)} = 100 \text{ Hz} \quad (8)$$

Where VOUT_DATA_X is the DAC code set in the LUT for every combination of the GPI inputs (VOUT-DATA-X).

For a duty cycle duty cycle of 12.5%, the VOUT_DATA_X is calculated by:

$$VOUT_DATA_X_{TRIANGLE} = FUNCTION_MAX - CEILING\left(\frac{FUNCTION_MAX - FUNCTION_MAX}{CODE_STEP}\right) \times Duty_Cycle = 725 - 2 \times CEILING\left(\frac{725 - 100}{1}\right) \times 0.125 = 646.88 \quad (9)$$

This result is rounded up to 647d (0x287). [Table 8-2](#) lists the LUT table values for the remaining duty cycles.

Table 8-2. LUT Codes

DUTY CYCLE	VOUT_DATA_X
12.5%	0x287
25%	0x239
37.5%	0x1EB
50%	0x19D
62.5%	0x14E
75%	0x100
87.5%	0x0B2
100%	0x064

The LUT codes are written to the DAC outputs depending on the state of the three GPI pins. The DAC codes do not have to increase chronologically with the GPIs. A programmable delay can be used so that the DAC output changes only after the GPIs have settled to avoid any switching noise on the output. The delay setting is 16 bits with a step size of 160 μ s, and is stored in the GPI-DEBOUNCE SRAM register. Set the delay code to 312d for a 50-ms delay.

The oscillator error is directly reflected on the output frequency of the PWM signal. This error can be compensated for by adjusting the margin-high and -low codes to adjust the frequency of the triangle wave generated on channel 0. The DAC539G2-Q1 oscillator error is stored in SRAM register 0x9E. This error is a 6-bit value with a code step of 0.2%, so the margin-high and -low codes can be modified to correct for –6.4% to +6.2% of error. For example, for code 0x2C, the oscillator error is –4%, or the frequency is 4% higher than the target. Increase the margin high – margin low differential value so that the calculated frequency is 4% lower than the target value.

Follow these guidelines to set up the registers on the DAC539G2-Q1:

- Stop the state machine before updating the application parameters by writing 0 to the STATE-MACHINE-CONFIG register.
- Set all of the application parameters shown in [Table 8-3](#). These locations must be used to save the settings in the NVM. For example, the DAC register locations for FUNCTION-CONFIG, FUNCTION-MAX, and FUNCTION-MIN are not mapped to the NVM and are not saved when an NVM write is triggered.
- If the function generator is already running, the function generator must be stopped before any changes to the triangle wave take effect. Write a 0 to the START-FUNC field in the COMMON-DAC-TRIG register (0x21) to stop the function generator. The function generator is automatically started when the state machine is enabled.
- VOUT-DATA-0 and VOUT-DATA-7 correspond to the three GPIs being set to 0b000 and 0b111, respectively.
- Configure the reference for both channels in the DAC-X-VOUT-CMP-CONFIG register. Set the reference for channel 1 to the same reference chosen for channel 0.
- Configure DAC channel 0 in triangle-wave mode with the chosen slew rate and code step in the FUNCTION-CONFIG SRAM register.
- Set the margin-high and margin-low codes for the channel 0 triangle wave in the FUNCTION-MAX and FUNCTION-MIN SRAM registers, respectively.
- Power on the DAC outputs in voltage mode using the COMMON-CONFIG register.
- Set the DEVICE-MODE-CONFIG register to 0x8040.
- Start the state machine by writing 3d to the STATE-MACHINE-CONFIG.
- Trigger an NVM write by setting the NVM-PROG bit in the COMMON-TRIGGER register (0x20) to 1.

Table 8-3. Application Parameters

REGISTER FIELD NAME	ADDRESS [FIELD]	ADDRESS LOCATION
FUNCTION-CONFIG	0x20[10:9][6:0]	SRAM
FUNCTION-MAX	0x21[15:6]	SRAM
FUNCTION-MIN	0x22[15:6]	SRAM
GPI-DEBOUNCE	0x23[15:0]	SRAM
VOUT-DATA-0	0x24[15:6]	SRAM
VOUT-DATA-1	0x25[15:6]	SRAM
VOUT-DATA-2	0x26[15:6]	SRAM
VOUT-DATA-3	0x27[15:6]	SRAM
VOUT-DATA-4	0x28[15:6]	SRAM
VOUT-DATA-5	0x29[15:6]	SRAM
VOUT-DATA-6	0x2A[15:6]	SRAM
VOUT-DATA-7	0x2B[15:6]	SRAM
DAC-0-VOUT-CMP-CONFIG	0x15[12:10][4:0]	Register
DAC-1-VOUT-CMP-CONFIG	0x03[12:10][4:0]	Register
COMMON-CONFIG	0x1F[15:0]	Register
DEVICE-MODE-CONFIG	0x25[15:0]	Register
STATE-MACHINE-CONFIG	0x27[2:0]	Register

Only the bits listed in the address column of [Table 8-3](#) are saved in NVM and used in the state machine. For example, only bits 12 to 10, and 4 to 0 are saved in NVM for the DAC-X-VOUT-CMP-CONFIG registers.

The pseudocode for this application example is as follows:

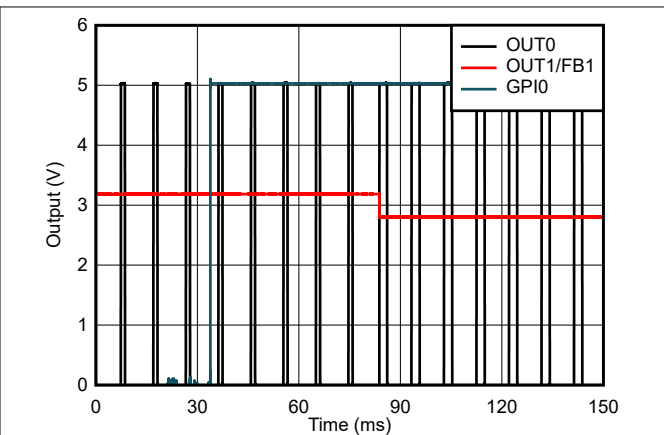

```
//SYNTAX: WRITE <REGISTER NAME(Hex Code)>, <MSB DATA>, <LSB DATA>
//Stop the state machine
WRITE STATE-MACHINE-CONFIG(0x27), 0x00, 0x03
//Stop the function generator

Figure 8-3. PWM Out: 12.5% to 25% Duty Cycle Transition

8.3 Power Supply Recommendations

The DAC539G2-Q1 does not require specific power-supply sequencing. These devices require a single power supply, V_{DD} . However, make sure the external voltage reference is applied after V_{DD} . Use a 0.1- μF decoupling capacitor for the V_{DD} pin. Use a bypass capacitor with a value of approximately 1.5 μF for the CAP pin.

8.4 Layout

8.4.1 Layout Guidelines

The DAC539G2-Q1 pin configuration separates the analog, digital, and power pins for an optimized layout. For signal integrity, separate the digital and analog traces, and place decoupling capacitors close to the device pins.

8.4.2 Layout Example

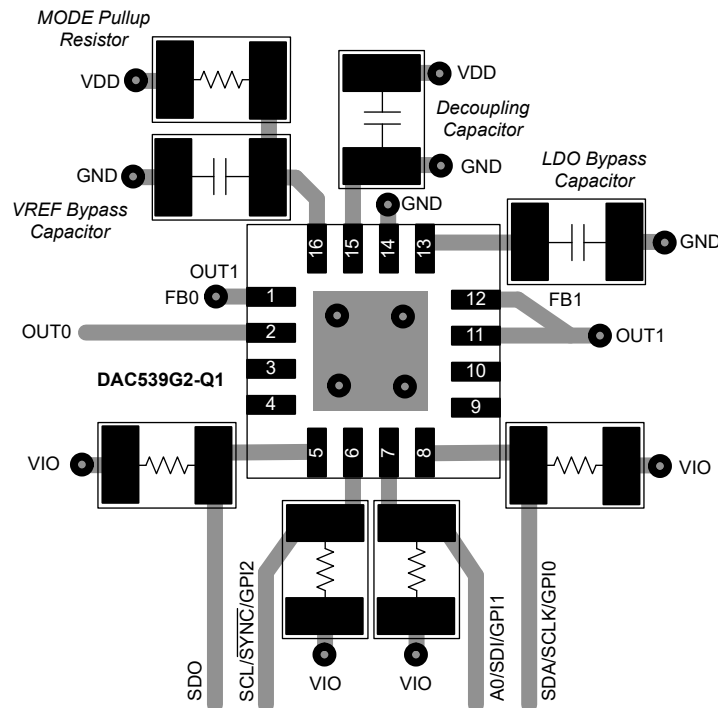

Figure 8-4. Layout Example

Note: The ground and power planes have been omitted for clarity. Connect the thermal pad to ground.

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.1 Documentation Support

Note

TI is transitioning to use more inclusive terminology. Some language may be different than what you would expect to see for certain technology areas.

9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.3 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC539G2RTERQ1	ACTIVE	WQFN	RTE	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	539G2Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
