24-CH PROGRAMMABLE CAPACITIVE TOUCH SENSOR

July 2023

GENERAL DESCRIPTION

IS31SE5120A is an ultra-low-power, 24-channel capacitive touch controller. The controller allows sleep mode (under 10uA) and uses auto-detection for wakeup. It also provides a shield output to increase moisture immunity. The built-in hardware monitor and calibration feature for the environment is to prevent false triggers.

A host MCU is required to communicate with IS31SE5120A. An on-chip I²C slave controller with 400kHz capability serves as the communication port for the host MCU. An interrupt, INT, can be configured and it is generated when a touch trigger event occurs. The trigger event can be configured by setting the interrupt register. IS31SE5120A can support proximity sensing.

IS31SE5120A is available in the QFN-32 package. It operates from 2.3V to 5.5V over the temperature range from -40°C to +105°C.

Note 1: The IC should be placed far away from the noise source to prevent EMS.

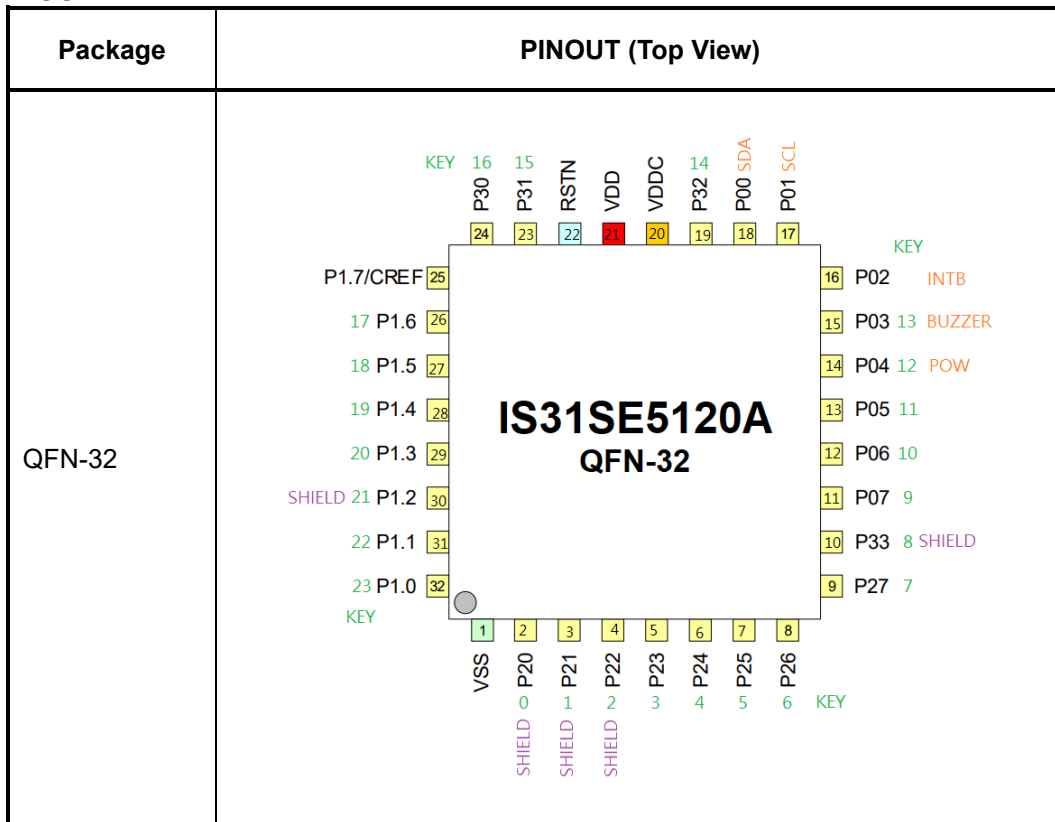

Note 2: The R_S and C_S should be placed as close to the IC as possible to reduce EMI.

Note 3: The capacitors connected to VDD and VDDC should be as close to the IC as possible to reduce EMI.

Note 4: The capacitor 1uF connected to VDDC might need to be removed for quick VDD rising time application.

IS31SE5120A

Baseline process based on the difference between baseline and raw count

Baseline will be updated to the current raw count based on the below factors. For detailed information about baseline, please refer to Section 4.4.2 Key parameter in “IS31SE5120A Eval Board User’s Manual” application note.

Positive noise threshold

Baseline is updated if the difference count of baseline count and raw count is below the positive noise threshold.

Negative noise threshold

It is used with the low baseline reset count to reset baseline count to the current raw count. Please refer to the description of **Low baseline reset**.

Low baseline reset

Low baseline reset count of each key. A reset count increases one if the absolute $|raw\ count - baseline| > negative\ noise\ threshold$. Once the reset count exceeds the low baseline reset register value, the baseline is reset to the current raw count. The reset count will be reset to 0 if the absolute $|raw\ count - baseline| \leq negative\ noise\ threshold$.

DETAILED DESCRIPTION

I2C INTERFACE

S31SE5120A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. IS31SE5120A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 "0" for a write command and set A0 "1" for a read command.

The complete slave address is:

Bit	A7:A1	A0
Value	0111100	1/0

The SCL line is uni directional. The SDA line is bi-directional (open collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. During communication, the microcontroller is the master and IS31SE5120A is the slave.

The timing diagram for the I2C is shown in Figure 6. The SDA is latched on to the stable high level of the SCL. When there is no bus activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, and the most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the device address is sent, the master checks for "acknowledge" from IS31SE5120A. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If IS31SE5120A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31SE5120A, the register address byte is sent, and the most significant bit first. IS31SE5120A must generate another acknowledgment indicating that the registered address has been received.

Then 8-bit of data bytes are sent next, the most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, IS31SE5120A must generate another acknowledgment to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

READ PORT REGISTERS

To read the device data, the bus master must first send the address of IS31SE5120A with the R/W bit set to "0", followed by the command byte, which determines which register is accessed. After a restart, the bus master must send IS31SE5120A address with the R/W bit set to "1". Data from the register defined by the command byte is sent from IS31SE5120A to the master (Figure 9).

TK3PUD is to configure a constant DC pull-up/pull-down on pin Cref to allow high capacitance touch-key detection. A DC pull-up/pull-down can compensate for the equivalent resistance which is caused by a high capacitance key. Connecting a constant current source or resistor can thus maintain touch key detection sensitivity. In general, we will try to maintain the raw count around half of CCNT for the case without key touch.

For DC current, PUD [3:0] enables 8uA/4uA/2uA/1uA current source. For Resistor, PUD [3-0] enables 5K/10K/20K/40K resistor.

TK3 PUD is to configure a constant DC pull-up/pull-down on pin Cref to allow high capacitance touch-key

detection. A DC pull-up/pull-down can compensate for the equivalent resistance caused by a high capacitance key. Connecting a switching current source or resistor can thus maintain touch key detection sensitivity.

For DC current, PUD[3:0] can enable 8uA/4uA/2uA/1uA current source. For Resistor, PUD[3-0] can enable 5K/10K/20K/40K resistor.

BM Buzzer/Melody Register Read. It shows the available tone buffer size. IS31SE5120A has 10 built-in note buffers.

I2C command format - Each note is composed of 4-byte data, and the incomplete note will be ignored. The incoming note data will be ignored if the FIFO is full.

0x78, 0x09, (Sid, Tt, Tw, Tp), (Sid, Tt, Tw, Tp),

0x78, 0x09, 0xFF stop the melody play and clear the FIFO

0x78, 0x09 Set the register number to 0xF0

0x79 Read FIFO remaining length

Reference schematic and tone waveform are introduced as follows:

Figure 10: Buzzer/ Melody waveform example

Note:

$T_{\text{ramp-up}}$: 100R as below figure 11 decides the signal ramp-up rate.

$T_{\text{ramp-down}}$: The signal ramps down because POW is low and 47uF capacitor as below figure 11 decides the ramp-down rate.

TYPICAL APPLICATION INFORMATION

The IS31SE5120A is an ultra-low-power, fully integrated 24-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric material such as glass or plastic.

SENSITIVITY ADJUSTING

Sensitivity can be adjusted by the external capacitor or internal register.

A higher capacitor value will yield lower detection sensitivity. A lower capacitor value will yield higher detection sensitivity.

INTERRUPT

Touch key detection event will trigger the INTB pin. The INTB pin will be driven low when the selected channel is pressed or released.

Sleep Mode

IS31SE5120A can be put in sleep mode to save power consumption and the device can be woken up by touching the selected keys. For the detailed application, please refer to the Lumissil application note “**How to program SE5117_SE5118_SE5120 into auto sleep mode?**”. We also provide a sample code for this application.
